YES WE CAN!

Balloon Gas Fact Sheet

How many latex balloons can be filled from a cylinder?

Provided the fitting instructions are followed and balloons are inflated 28cm from the top to the neck of the balloon, our easy reference system can be followed:

0.6m ³	=	50 Balloons
1.2m ³	=	100 Balloons
3.5m ³	=	300 Balloons
9.1m ³	=	800 Balloons

Note: overfilling balloons will alter these numbers.

How long will latex balloons stay in the air?

This depends on the volume of the balloon and the air temperature. As a guide the average is: 8 to 12 hours at normal room temperature (20-25°C).

Is it important which brand of balloons are used?

The recommended number of balloons obtained from any gas cylinder is based on using good quality balloons 28cm in diameter. If the balloons are larger than this you will reduce the number of balloons obtained from each cylinder. We only recommend biodegradable environmentally friendly balloons. Ask your sales representative for assistance if you are still unsure.

Is balloon gas safe?

Balloon Gas is Helium. Helium is non-toxic and non-flammable therefore quite harmless. However, Balloon Gas should not be inhaled. The party trick of inhaling a balloon full of Balloon Gas to change voices is dangerous and must be discouraged at all times. See first aid instructions.

What are foil balloons?

Foil balloons are a special laminate which allow the Balloon Gas to be contained far longer than latex. A standard 45cm foil balloon will stay inflated for about a week and larger balloons for about 2 weeks. Most foil balloons feature a self-sealing valve which means the balloon can be re-inflated 2 or 3 times before the valve becomes unreliable. There is an extensive range of foil balloons with written messages.

Helium Inhalation Is No Laughing Matter

WARNING

*Do not inhale.
Inhaling balloon
gas can
cause death.*

If you've ever been to a party and inhaled helium so that you sound like Donald Duck, you could be putting your life at risk. Evidence has proven that the inhalation of helium can be fatal, yet thousands of party goers inhale helium thinking it is very funny rather than life threatening. The inhalation of helium cuts off a person's supply of oxygen and can cause dizziness, unconsciousness and ultimately death! According to Consultant Occupational Health Physician Dr Greg McGroder, "Australians have not yet realised the extreme danger associated with helium inhalation."

If the concentration of oxygen is decreased below 18% within the human body, symptoms and signs of Asphyxia can occur. Helium gas can totally displace the available oxygen and if this is maintained for even a few seconds, asphyxia and death can and will occur."

First Aid

- If the victim inhaled the gas remove them to fresh air. Apply artificial resuscitation if necessary. Treat for shock if required.
- Call for emergency medical treatment, 000.

Cylinder Safety

- Keep cylinders upright and protect the valves from physical damage. Secure cylinders when standing.
- If valve is damaged, do not attempt to operate.
- If valve does not operate by hand, return the cylinder to the supplier.

1

Place balloon over end of nozzle and hold securely

2

Tilt nozzle in a forward direction for gas to flow

3

Release nozzle when balloon reaches 28cm from neck to top

4

Attach clip: Remove balloon from nozzle and twist neck for approx 5cm

5

Pass balloon end to end through clip at least three times

6

Balloon is ready
